

STUDY OF STRUCTURE AND OPERATORS ON ALMOST KAEHLERIAN MANIFOLDS

Abstract

Kodaira and Spencer (1957) have studied on the variation of almost complex structure. Hsiung (1966) has defined and studied structures and operators on almost Hermitian manifolds. Also, Ogawa (1970) has studied operators on almost Hermitian manifolds. In this paper, we have defined and studied structure and operators on almost Kaehlerian spaces and several theorems have been derived. We have also been demonstrated with in nearly Kaehlerian spaces that for the structure to be integrable, it is both necessary and sufficient that the square of the difference between Γ and γ , i. e., $(\Gamma - \gamma)^2 = 0$. Additionally, when the operator Γ^2 vanishes across the entire space, then the space can be classified as Kaehlerian.

Keywords: Almost complex structure, almost Hermitian spaces, almost Kaehlerian spaces, Kaehlerian spaces.

I. INTRODUCTION

Consider M^n as a Riemannian space, where its fundamental metric tensor is denoted as g_{ij} , and $g = \det|g_{ij}|$. In this context, Greek indices i, j, k , and so on, range from 1 to n , which is the dimension of the space. Let $\varepsilon_{i_1, \dots, i_p}^{j_1, \dots, j_p}$ represent the generalized Kronecker's delta, and $\varepsilon_{i_1, \dots, i_p}$ signify $\varepsilon_{i_1, \dots, i_p}^{1, \dots, p}$. We define F^p as the algebra of differential p -forms on M^n . Consequently, the operators of exterior differentiation $d: F^p \rightarrow F^{p+1}$, and the adjoint operator $d': F^p \rightarrow F^{n-p}$ can be expressed for a p -form $u = (u_{i_1, \dots, i_p})$ as follows:

$$(du)_{i_0, \dots, i_p} = \frac{1}{p!} \varepsilon_{i_0, \dots, i_p}^{\rho j_1, \dots, j_p} \nabla_{\rho} u_{j_1, \dots, j_p} \quad (1.1)$$

$$(d'u)_{i_1, \dots, i_{n-p}} = \frac{1}{p!} \sqrt{g} g^{\rho_1 j_1, \dots, \rho_p j_p} u_{\rho_1, \dots, \rho_p} \varepsilon_{j_1, \dots, j_p}^{i_1, \dots, i_{n-p}} \quad (1.2)$$

where ∇_j represents the covariant differentiation concerning the Riemannian connection, the exterior co-differentiation $\delta: F^p \rightarrow F^{p-1}$ is specified by

$$\delta = (-1)^{np+n+1} d' d \quad (1.3)$$

can be expressed locally as

$$(\delta u)_{i_2, \dots, i_p} \nabla^{\rho} u_{\rho i_2, \dots, i_p} \quad (1.4)$$

Let Δ be the Laplace-Beltrami operator defined by $\Delta = d\delta + \delta d$

Subsequently, utilizing equations (1.1) and (1.3), it is straightforward to confirm that in the case of a p -degree form u ,

$$(\Delta u)_{i_1, \dots, i_p} = -\nabla^{\rho} \nabla_{\rho} u_{i_1, \dots, i_p} + \sum_{i=1}^p R_{i\lambda}^{\rho} u_{i_1, \dots, \hat{i}_\lambda, \dots, i_p} \quad (1.5)$$

$$+ \sum_{\lambda < \mu} R_{i\lambda i\mu}^{\rho\alpha} u_{i_1, \dots, \hat{\rho}, \dots, \hat{\alpha}, \dots, i_p}$$

holds, where R_{ijkl} (or R_{ij}) represents the curvature (or Ricci) tensor linked to the Riemann connection. In the notation $u_{i_1, \dots, \hat{i}_\lambda, \dots, i_p}$, the index ρ replaces the index i_λ , while in $u_{i_1, \dots, \hat{i}_\alpha, \dots, i_p}$ indicates that the subscript i_α is deleted.

If a Riemannian space M^n admits an almost complex structure A_i^j satisfying

$$g_{kh} A_i^k A_j^h = g_{ij} \quad (1.6)$$

then it is called an almost Hermitian space. If in an almost Kaehler space, the Nijenhuis tensor satisfies the condition $N_{jih} + N_{jhi} = 0$, then we deduce from it $G_{jih} = 0$, i.e. $F_{i,j}^h + F_{j,i}^h = 0$ and the space is an almost Tachibana space. Thus, we have $3F_{ih,j} = F_{j,i,h} = 0$. Consequently, the space is a Kaehler space i.e., an almost Kaehler space is a Kaehler space, if and only if the Nijenhuis tensor equation is satisfied.

Let $T^c(M)$ represent complexified tangent space of the manifold M^n . Consider F_c^p as the space of complexified differential p -forms, which are essentially complex-valued functions defined

on $T^c(M) \wedge \dots \wedge T^c(M)$. For non-negative integers r, s we introduce the projection mapping denoted by $\prod_{r,s} F_c^p \rightarrow F_c^p$ where $p = r + s$ as follows:

$$\prod_{1,0}^j = \left(\frac{1}{2}\right) (\delta_i^j - \sqrt{-1}A_i^j) \quad (1.7)$$

and its conjugate

$$\prod_{0,1}^j = \bar{\prod}_i^j = \left(\frac{1}{2}\right) (\delta_i^j + \sqrt{-1}A_i^j) \quad (1.8)$$

which will be abbreviated to \prod and $\bar{\prod}$ respectively. Then for a p -form u of F_c^p , we define:

$$\begin{aligned} (\prod u)_{i_2, \dots, i_p} &= \left(\frac{1}{p!}\right) \prod_{i_2, \dots, i_p}^{j_1, \dots, j_p} u_{j_1, \dots, j_p} \\ &= \left[\frac{1}{(r!s!)}\right] \varepsilon_{i_1, \dots, i_p}^{t_1, \dots, t_r, h_1, \dots, h_s} \prod_{t_1}^{j_1} \dots \prod_{t_r}^{j_r} \bar{\prod}_{h_1}^{k_1} \dots \bar{\prod}_{h_s}^{k_s} u_{j_1, \dots, j_r, k_1, \dots, k_s}. \end{aligned} \quad (1.9)$$

A p -form u of F_c^p is called of type (r,s) if it satisfies $(\prod u) = u$.

Now, here following two Lemmas given by [Kodaira and Spencer (1957)], Ogawa (1970),

Lemma (1.1): In an almost complex space, for any set of functions u_{i_1, \dots, i_p} , we have

$$\sum_{(p-v, v)}^p (\prod u)_{i_1, \dots, i_p} = u_{i_1, \dots, i_p} \quad (1.10)$$

and

$$\begin{aligned} \sum_{v=0}^p C_p \varepsilon_{j_1, \dots, j_p}^{\rho_1, \dots, \rho_p} \prod_{\rho_1}^{j_1} \dots \prod_{\rho_v}^{j_v} \bar{\prod}_{\rho_{v+1}}^{j_{v+1}} \dots \bar{\prod}_{\rho_p}^{j_p} u_{j_1, \dots, j_p} \\ = \varepsilon_{i_1, \dots, i_p}^{j_1, \dots, j_p} u_{j_1, \dots, j_p} \end{aligned} \quad (1.11)$$

holds for any p -form u_{j_1, \dots, j_p} , $1 \leq p \leq n$.

Now we define the operators $d_1: F_c^p \rightarrow F_c^{p+1}$ of type $(1,0)$ and $d_2: F_c^p \rightarrow F_c^{p+1}$ of type $(2, -1)$ in accordance with [Kodaira and Spencer (1957)] given by

$$= \sum \prod d \prod, \quad (1.12)$$

$r+s=p$ $r+1,s$ r,s

$$d_2 = \sum \prod d \prod. \quad (1.13)$$

Here we denote the conjugate operator of d_1 (or d_2) by \bar{d}_1 (or \bar{d}_2).

Lemma (1.2): In an almost complex space, on F_c^p , we have

$$\prod_{r,s} d \prod = 0, \quad (1.14)$$

where, $r + s = p$.

From Lemmas (1.1) and (1.2), we have[2] [Kodaira and Spencer (1957)] given by

$$d = d_1 + d_2 + \bar{d}_1 + \bar{d}_2 \quad (1.15)$$

The definitions of complex counterparts of the real operators d and δ , as per the framework established by Kodaira-Spencer in their (1957) work [2], can be stated as follows:

$$\partial = 2d_2 + d_1 - \bar{d}_2 \quad (1.16)$$

$$\mathfrak{D} = - * \partial * \quad (1.17)$$

On the other hand, Hsiung (1966) defined them by the following operators

$$(\partial u)_{i_0 \dots i_p} = \left(\frac{1}{p!}\right) \sum_{r+s=p} \prod_{i_0 \dots i_p}^{t j_1 \dots j_p} \prod_t^h \nabla_h u_{j_1 \dots j_p}, \quad (1.18)$$

$$(\mathfrak{D}u)_{i_0 \dots i_p} = - \sum_{r,s} \prod_{i_2 \dots i_p}^{j_1 \dots j_p} \prod_h^t \nabla_h u_{j_1 \dots j_p}, \quad (1.19)$$

for a p -form $u = (u_{i_1 \dots i_p})$. After then we shall show that the relation

$$\mathfrak{D} = - * \partial * \quad (1.20)$$

is valid.

II. OPERATORS ON ALMOST KAEHLERIAN MANIFOLDS

We have studied the following properties of the operators

Lemma (2.1): In an almost Kaehlerian space, the operator Γ is skew-derivation and satisfies

$$* \Gamma * = - D \quad (2.1)$$

Proof: Ogawa (1967) gives that Γ is a skew-derivation and that for any p -form u

$$= u_{i_1 \dots i_p}, (* \Gamma * u)_{i_2 \dots i_p} = (-1)^{np+n+1} (Du)_{i_2 \dots i_p}$$

holds, where n is the dimension of the space. Since n is even, therefore

(2.1) is proof.

Lemma (2.2): In an almost Kaehlerian space, the operator \emptyset is a derivation and satisfies for any p -form u_p ,

$$* \emptyset * u_p = (-1)^p \emptyset u_p, \quad (2.2)$$

$$d\emptyset - \square d = -\Gamma + Y \quad (2.3)$$

Proof: From directive calculation with respect to an orthonormal local coordinate system for any p -form $u = u_{i_1 \dots i_p}$, we have

$$\begin{aligned} (* \emptyset * u)_{i_1 \dots i_p} &= \left(\frac{1}{(n-p)! p!}\right) g^{j_1 j_1} \dots g^{j_{n-p} j_{n-p}} g^{k_1 r_1} \dots g^{k_p r_p} u_{k_1 \dots k_p} \\ &= (-1)^{p(n-p)} (\square u)_{k_1 \dots k_p}. \end{aligned}$$

Since n is even, we have $(-1)^{p(n-p)} = (-1)^p$, and thus (2.2) is proved.

Now, we have

$$\begin{aligned} (d\phi u)_{i_0 \dots i_p} &= \nabla_{i_0} A_{i_r}^t u_{i_1 \dots \hat{i}_r \dots i_p}^r - \nabla_{i_r} A_{i_0}^t u_{i_1 \dots \hat{i}_0 \dots i_p}^r \\ &- \sum_{r \neq s} \nabla_{i_r} A_{i_s}^t u_{i_1 \dots \hat{i}_0 \dots \hat{i}_r \dots i_p}^r + A_{i_r}^t \nabla_{i_0} u_{i_1 \dots \hat{i}_0 \dots i_p}^r \\ &\quad - A_{i_0}^t \nabla_{i_r} u_{i_1 \dots \hat{i}_r \dots i_p}^r - \sum_{r \neq s} A_{i_s}^t \nabla_{i_r} u_{i_1 \dots \hat{i}_0 \dots \hat{i}_r \dots i_p}^r \\ (\square du)_{i_0 \dots i_p} &= A_{i_0}^t \nabla_t u_{i_1 \dots i_p} - A_{i_s}^t \nabla_t u_{i_1 \dots \hat{i}_0 \dots i_p}^s \\ &+ A_{i_r}^t \nabla_{i_0} u_{i_1 \dots \hat{i}_r \dots i_p}^r - A_{i_0}^t \nabla_{i_r} u_{i_1 \dots \hat{i}_0 \dots i_p}^r \\ &- \sum_{r \neq s} A_{i_s}^t \nabla_{i_r} u_{i_0 \dots \hat{i}_r \dots \hat{i}_s \dots i_p}^s. \end{aligned}$$

Hence it follows that

$$\begin{aligned} (d\phi u - \square du)_{i_0 \dots i_p} &= (\nabla_{i_0} A_{i_r}^t - \nabla_{i_r} A_{i_0}^t) u_{i_1 \dots \hat{i}_r \dots i_p}^r - \sum_n (-1)^n A_{i_n}^t \nabla_t u_{i_0 \dots \hat{i}_n \dots i_p} \\ &+ \sum_{r < s} (-1)^r (\nabla_{i_r} A_{i_s}^t - \nabla_{i_s} A_{i_r}^t) u_{i_0 i_1 \dots \hat{i}_r \dots \hat{i}_s \dots i_p}^s. \\ &= \sum_{n < m} (-1)^n (\nabla_{i_n} A_{i_m}^t - \nabla_{i_m} A_{i_n}^t) u_{i_0 \dots \hat{i}_n \dots \hat{i}_m \dots i_p}^m \\ &\quad - \sum_n (-1)^n A_{i_n}^t \nabla_t u_{i_0 \dots \hat{i}_n \dots i_p}. \\ &= (Y u - \Gamma u)_{i_0 \dots i_p}. \end{aligned}$$

Now, we have consider the following relation

$$\begin{aligned} \sum_{s=1}^p \varepsilon_{i_1 \dots \hat{i}_s \dots i_{p+q}}^{j_1 \dots \hat{j}_s \dots j_{p+q}} A_{i_s}^{j_s} + \sum_{s'=p+1}^{p+q} \varepsilon_{i_1 \dots \hat{i}_{s'} \dots i_{p+q}}^{j_1 \dots \hat{j}_{s'} \dots j_{p+q}} A_{i_{s'}}^{j_{s'}} \\ = \sum_{n=1}^{p+q} A_{i_n}^t \varepsilon_{i_1 \dots \hat{i}_n \dots i_{p+q}}^{j_1 \dots \hat{j}_n \dots j_{p+q}}, \end{aligned}$$

Then, we have

$$\begin{aligned} (\square u \wedge v)_{i_1 \dots i_{p+q}} + (u \wedge \square v)_{i_1 \dots i_{p+q}} \\ = \left(\frac{1}{(p!q!)} \right) \left[\sum_{r=1}^p \varepsilon_{i_1 \dots \hat{i}_r \dots i_{p+q}}^{j_1 \dots \hat{j}_r \dots j_{p+q}} A_{i_r}^{j_r} u_{j_1 \dots \hat{j}_r \dots j_p}^s v_{j_{p+1} \dots j_{p+q}} \right. \\ \left. + \sum_{s'=p+1}^{p+q} \varepsilon_{i_1 \dots \hat{i}_{s'} \dots i_{p+q}}^{j_1 \dots \hat{j}_{s'} \dots j_{p+q}} A_{i_{s'}}^{j_{s'}} u_{j_1 \dots j_p} v_{j_{p+1} \dots \hat{j}_{s'} \dots j_{p+q}} \right] \\ = \left(\frac{1}{(p!q!)} \right) \sum_{n=1}^{p+q} A_{i_n}^t \varepsilon_{i_1 \dots \hat{i}_n \dots i_{p+q}}^{j_1 \dots \hat{j}_n \dots j_{p+q}} u_{j_1 \dots j_p} v_{j_{p+1} \dots j_{p+q}} \\ = \phi (u \wedge v)_{i_1 \dots i_{p+q}} \end{aligned}$$

Thus, the operator \square is a derivation. From this, we have the following:

Corollary(2.1): In almost Kaehlerian space, the operator Y is a skew-derivation.

Corollary(2.2): In almost Kaehlerian space, the relation

$$d\Gamma + \Gamma d = dY + Yd \quad (2.4)$$

holds.

Theorem(2.3): In almost Kaehlerian spacer, we have

$$*Y* = -\mathfrak{D} - i(\delta A) \quad (2.5)$$

where $i(\delta A)$ denotes the inner product with respect to a 1-form $\delta A (A = A_{ij})$

Proof: We have the definition of Y , for $a-p$ -form u ,

$$(Yu)_{i_0 \dots i_p} = \sum_{n < m} (-1)^n T_{i_n i_m}^t u_{i_0 \dots \hat{i}_n \dots \hat{i}_m \dots i_p}^m,$$

Where, we write $T_{ij}^t = \nabla_i A_j^t - \nabla_j A_i^t$. Therefore we have

$$\begin{aligned} (*Y* u)_{i_2 \dots i_p} &= \frac{g}{(a-p+1)! p!} \sum_{1 \leq r < s \leq a-p+1} (-1)^{r-1} T_{jr js}^h \\ &\quad \cdot g^{t_1 j_1} \dots g^{t_{a-p+1} j_{a-p+1}} g^{h_1 k_1} \dots g^{h_p k_p} \\ &\quad \cdot u_{k_1 \dots k_p} \varepsilon_{h_1 \dots h_p j_1 \dots \hat{j}_r \dots \hat{j}_s \dots j_{a-p+1}}^s \varepsilon_{t_1 \dots t_{a-p+1} i_2 \dots i_p} \\ &= \frac{(-1)^{r(p-1)(a-p+1)}}{(a-p+1)(a-p)p!} \sum_{r < s} T_{\tau}^{t_r t_s} \varepsilon_{j_2 \dots j_p t_r t_s}^{k_1 \dots k_p \tau} u_{k_1 \dots k_p} \\ &= -\nabla^l A_l^t u_{t i_2 \dots i_p} - \sum_{n=2}^p (-1)^n \nabla^t A_{i_n}^h u_{th i_2 \dots \hat{i}_n \dots i_p} \\ &= [i(\delta A)u - \mathfrak{D}u]_{i_2 \dots i_p}. \end{aligned}$$

Similarly, we have proof of the following:

Theorem (2.4): In an almost Kaehlerian space, we have

$$\mathfrak{D} = (d - \sqrt{-1}\Gamma)/2, \quad (2.6)$$

$$\mathfrak{D} = (\delta - \sqrt{-1}D)/2, \quad (2.7)$$

$$\bar{\mathfrak{D}} = (d + \sqrt{-1}\Gamma)/2, \quad (2.8)$$

$$\bar{\mathfrak{D}} = (\delta + \sqrt{-1}D)/2, \quad (2.9)$$

$$\mathfrak{D} = [d - \sqrt{-1}(\Gamma - Y)]/2, \quad (2.10)$$

$$\mathfrak{D} = [\delta - \sqrt{-1}\{D - \mathfrak{D} - i(\delta A)\}]/2, \quad (2.11)$$

III. STRUCTURE ON ALMOST KAEHLERIAN SPACES

Theorem (3.1): In an almost Kählerian space, the structure's integrability is both a necessary and sufficient condition when:

$$(\Gamma - Y)^2 = 0.$$

Proof. We have the integrability condition of the almost complex structure is defined by $\partial^2 = 0$, given by [2] Kodaira and spencer(1957), Then by equation (2.10)

$$\partial^2 = \frac{1}{4} [-(\Gamma - Y)^2 + \sqrt{-1}(d\Gamma + \Gamma d - dY - Yd)],$$

Considering that the imaginary components disappear due to the implication of *Corollary* (2.2), we derive the result: $\partial^2 = -\frac{1}{4}(\Gamma - Y)^2$ Which is real operator.

The operator Γ which delineates a Kählerian structure through an almost Hermitian structure, demonstrates Kählerian characteristics only when the operator Γ^2 ceases to have an effect. As Γ functions as a skew-derivation, its second operation, Γ^2 , acts as a derivation.

Consequently, when Γ^2 nullifies its impact on forms of degrees 0 and 1, its influence dissipates across forms of all degrees. Taking into consideration a 0-form f and a 1-form $u = (u_i)$, the following relationship holds:

$$\begin{aligned}(\Gamma^2 f)_{ij} &= (A_i^t \nabla_t A_j^h - A_j^t \nabla_t A_i^h) \nabla_h f, \\(\Gamma^2 u)_{ijk} &= \bigcup_{i,j,k} (A_i^t \nabla_t A_j^h - A_j^t \nabla_t A_i^h) \nabla_h u_k + \bigcup_{i,j,k} (A_i^t A_j^h R_{thk}^l) u_l,\end{aligned}$$

Where $\bigcup_{i,j,k}$ indicates that the terms are summed cyclically with respect to i, j, k . Consequently, the condition $\Gamma^2 = 0$ can be expressed equivalently through the following relationships:

$$(A_i^t \nabla_t A_j^h - A_j^t \nabla_t A_i^h) = 0, \quad (3.1)$$

$$\bigcup_{i,j,k} (A_i^t A_j^h R_{thk}^l) = 0. \quad (3.2)$$

Theorem (3.2): In an almost Kaehlerian space, the operator Γ^2 consistently equals zero.

Proof: Since the complex structure A_i^j is a covariant constant in an Kaehlerian space, we have from (3.1) $A_i^t R_{tjk}^\omega = A_j^t R_{tik}^\omega$, and therefore $A_i^t A_j^h R_{thk}^\omega = R_{ijk}^\omega$, which gives (3.2) holds.

Theorem (3.3): In an almost Kaehlerian space, when $\Gamma^2 = 0$, it signifies that the structure is almost semi-Kaehlerian.

Proof: We have, Transvecting (3.1) with A_i^i , then $\nabla_l A_j^h + A_i^i A_j^t \nabla_t A_i^h = 0$. Contracting l and h and noting $A^{ih} \nabla_t A_{ih} = 0$. prove the theorem.

Theorem (3.4): If $\Gamma^2 = 0$ in an almost Kaehlerian space, then we have

$$\bigcup_{i,j,k} (A_i^t R_{jkt}^\omega) = 0 \quad (3.3)$$

$$\frac{1}{2} A^{th} R_{thi}^j + A_i^t R_t^j = 0, \quad (3.4)$$

$$A_i^t R_{tj} + A_j^t R_{ti} \quad (3.5)$$

Proof: Here, from equation (3.2), we get

$$A_i^t A_j^h A_k^l R_{thl}^\omega = A_i^t R_{ktj}^\omega - A_j^t R_{kti}^\omega \quad (3.6)$$

Taking the sum of terms of (3.6) cyclically with respect to the indices i, j, k , we have

$$\bigcup_{i,j,k} (A_i^t A_j^h A_k^l R_{thl}^\omega) = \bigcup_{i,j,k} (A_i^t R_{jkt}^\omega) = 0.$$

gives (3.3). Contraction of i and ω in (3.3) yields

$$A^{it} R_{itjk} + A_j^t R_{tk} - A_k^t R_{tj} = 0. \quad (3.7)$$

And, from equation (3.6) we get $-A_k^t A_i^h A_j^l R_{thl}^\omega = A_i^t R_{ktj}^\omega - A_k^t R_{iti}^\omega - A_j^t R_{kit}^\omega$,

Which can be reduced to (3.4) by contracting with g^{ij} . Also, from (3.7) and (3.4), then we get the relation (3.5).

Theorem (3.5): If $\Gamma^2 = 0$ in an almost Kaehlerian space, then we have

$$\nabla^i A^{jk} \nabla_j A_{i\omega} = 0. \quad (3.8)$$

Proof: We have, Differentiating (3.1) by ∇_i , then

$$A^{it} \nabla_i \nabla_t A_j^h = \nabla^i A_j^t \nabla_t A_i^h + A_j^t (R_{itl}^i A^{lh} + R_{itl}^h A^{il}).$$

From (3.4) and (3.5) and noting above equation, we get

$$\begin{aligned} & \left(\frac{1}{2}\right) A^{it} (\nabla_i \nabla_t A_j^h - \nabla_t \nabla_i A_j^h) \\ &= \left(-\frac{1}{2}\right) A^{it} R_{itj}^l A_l^h + \left(\frac{1}{2}\right) A^{it} R_{itl}^h A_j^l = -R_j^h + R_j^h = 0. \end{aligned}$$

Here, the second and third terms on the right-hand side are reduced to $-R_j^h$ and R_j^h , respectively and thus we have (3.8).

Theorem (3.6): If the operator Γ^2 vanishes everywhere in an almost Kaehlerian space, it implies that the space is Kaehlerian.

Proof: Here, firstly we prove that

$$A^{jk} \nabla^t \nabla_t A_{jk} = 0. \quad (3.9)$$

Then, by virtue of (3.1) we find $\nabla_i A_j^h = A_j^h A_l^t \nabla_t A_i^l$

the above equation and (3.8) and (3.5) gives $\nabla^i \nabla_i A_j^h = A_j^h \nabla^i A_l^t \nabla_t A_i^l$

Now contracting above equation with A_h^j and noting *theorem* (3.5), we obtain (3.9). From equation (3.9) follows immediately $\nabla^i A^{jk} \nabla_i A_{jk} = \left(\frac{1}{2}\right) \nabla^i \nabla_i (A^{jk} A_{jk}) - A^{jk} \nabla^i \nabla_i A_{jk} = 0$. Which means $\nabla_i A_{jk} = 0$. proving the structure to be Kaehlerian.
